WEEK 3 RESEARCH NOTEBOOK UPDATE:

As there is no standardization of language and terminology in this field, introducing it would indeed increase the accuracy of text analysis. We would need to establish a standard set of terminology and phrases used to describe the experiences and symptoms of menopause. This will indeed increase the accuracy of findings as it would ensure that all the info on the web is examined using uniform and exhaustive language.

Since it is not practically possible for all genders don't understand and feel the problems and experiences of menopause, we need to tackle the gender bias in this field as that decreases the accuracy of text analysis. We would need to adopt gender-neutral terminology and also avoid stereotypes as well as gendered preconceptions while describing menopause. This will in turn increase the accuracy of text analysis in this field.

Since everyone has different experiences and seeks support for a different thing, providing support is quite difficult as every individual has a different viewpoint on the experiences. This would require reading multiple texts from numerous sources to ensure that a broad range of opinions and experiences are taken into account. Since everyone has a different way of explaining things, we should acquire a more thorough picture of the experiences and needs of those seeking help.
